QUEENS DATA - LSTM - Multi-Step Forecast - Vector Output Model

Here I have done the following:

1. Followed steps from this website: https://machinelearningmastery.com/how-to-develop-lstm-models-for-time-series-forecasting/ (https://machinelearningmastery.com/how-to-develop-lstm-models-for-time-series-forecasting/)
2. Import necessary modules
3. Fixed the parameters of the code to take in input of previous 60 days and output the next 30 days
    - n_steps_in = 60
    - n_steps_out = 30
4. Define the model and predict 30 days of data
5. Note any observations

In [51]:
```
# Imports
import numpy as np
from numpy import array
from keras.models import Sequential
from keras.layers import LSTM
from keras.layers import Dense
import matplotlib.pyplot as plt
import pandas as pd
#Supress default INFO logging
%matplotlib inline
import warnings
warnings.filterwarnings('ignore')
import logging
logger = logging.getLogger()
logger.setLevel(logging.CRITICAL)
import logging, sys
warnings.simplefilter(action='ignore', category=FutureWarning)
```

In [52]:
```
df = pd.read_csv('datasets/rollingsales_queens.xls_prepped_bare.csv', usecols=['
```

In [53]:
```
df = df.dropna()
df = df.reset_index(drop=True)
```

In [54]:
```
df = df.rename(columns={'SALE DATE':'ts', 'SALE PRICE': 'y'})
df.columns = df.columns.astype(str)
df = df.set_index(['ts'], drop=True)
df.index= pd.to_datetime(df.index)
```

In [68]:
```
# df
```

In [56]:
```
df = df.resample('D').mean()
df = df.reset_index()
```

In [57]:
```
df.dropna(inplace=True)
df
```

Out[57]:

	ts	y
0	2020-04-01	961150.000000

Observation

Queens prices per model show stable with some dips
